Keywords: Supramolecular chemistry / Self-assembly / N ligands / Asymmetric catalysis / Acylation

A new class of oxazoline ligands, named SupraBox, was studied. These ligands possess an additional urea functionality to generate supramolecular bidentate ligands in transition-metal complexes, by the establishment of hydrogen bonds between the urea N-hydrogens of one ligand and the carbonyl oxygen of a second one. A library of 16 SupraBox ligands was prepared using 5 differently substituted oxazoline nuclei, 4 linkers and 3 different urea substituents. The

Introduction

The supramolecular assembly of biologically active species through hydrogen bonding is a widely occurring phenomenon in nature, as exemplified by DNA base pairing, the secondary or tertiary structure of proteins, or the mechanism of action of many enzymes. Taking inspiration from nature, chemists have designed and realized supramolecular catalysts in which a receptor or a cavitand is connected to an active site.^[1] In a closely related approach, chiral ligands for transition metals have also been developed that possess, as well as centers for coordinating to a metal ion, an additional functionality that is capable of ligandligand bonding by non-covalent interactions, such as hydrogen bonding or coordinative bonding. These ligands are usually referred to as "supramolecular bidentate ligands".^[2] This approach reduces the number of degrees of freedom in the resulting metal coordination complexes compared to the analogous complexes based on monodentate ligands, and this is expected to give a more pre-organized system

formation of copper(II) and palladium(II) complexes was investigated by MS, UV/Vis and ¹H-NMR spectroscopy. The SupraBox library was screened in the copper-catalyzed asymmetric benzoylation of *vic*-diols. Good selectivities were obtained in the kinetic resolution of racemic hydrobenzoin [up to 86% *ee* and selectivity (*s*) = 28] and in the desymmetrization of *meso*-hydrobenzoin (up to 88% *ee*).

with a better capability of controlling a subsequent metalcatalyzed reaction.

Among the different kinds of non-covalent interactions that have been used to date for developing supramolecular ligands, hydrogen bonds are arguably the most practical and efficient for several reasons: (i) functional groups capable of hydrogen bonding (e.g., amides, ureas, guanidines) are stable and relatively easy to introduce; (ii) hydrogen bonds are created dynamically and reversibly in the reaction medium (where catalysis is to take place), are able to self-repair when broken, and often coexist with other interactions in a "non-invasive" manner. In the last few years, several powerful supramolecular bidentate ligands with outstanding reactivity and selectivity have been described, but unfortunately, this concept has so far been exclusively confined to the use of phosphorus ligands.^[2]

In this paper, we report the first example of hydrogenbond-induced assembly of monodentate oxazolines for the formation of supramolecular bis(oxazoline) metal complexes and the use of their copper(II) complexes in asymmetric catalytic transformations.^[3]

Results and Discussion

Bis(oxazolines) (Box) have developed into one of the most useful ligand classes for asymmetric catalysis, due to their ability to coordinate a wide variety of metal ions. The resulting complexes can be used in a great number of catalytic processes with excellent reactivity and selectivity.^[4] The general structural motif of these ligands can be described

as being two oxazoline units connected by one of a wide range of linkers. These linkers tune the separation and the bite angle of the two oxazolines, and might also introduce additional stereogenic elements (centers or axes) to optimize the enantioselectivity of a given asymmetric reaction.

In our approach, a covalent linker is replaced by a hydrogen-bonding interaction between two urea moieties that are connected to the oxazoline rings by different spacers (Figure 1). The urea functionality has been used before as a self-complementary recognition motif in the formation of supramolecular bidentate phosphane and phosphite ligands.^[5]

Figure 1. SupraBox: general structure of the ligands and of the supramolecular bidentate complex.

Thus, the synthesis of a library of "SupraBox" ligands (1-16, Figure 2) was planned. Their structure allows a modular synthetic approach and the introduction of several sites of diversity for steric and electronic tuning of the ligand properties: (i) the spacer between the oxazoline and the urea moiety; (ii) the substituent at the oxazoline stereocenter; (iii) the substitution pattern on the urea moiety.

Synthesis of the Ligands

The ligands were prepared following a straightforward and reliable synthetic protocol involving only one or two chromatographic purifications (Schemes 1 and 2). For the synthesis of ligands 1–14 (Scheme 1), the amino acid linkers (i.e., 18) reacted with different isocyanates in THF or, where the substrate had limited solubility, in 2 N NaOH, to give the corresponding acid ureas (i.e., 19).^[6] These were then coupled to amino alcohols using HBTU (*O*-benzotriazole-N,N,N',N'-tetramethyluronium hexafluorophosphate) in dichloromethane. The ring closure and the formation of oxazolines 1–14 was achieved in good yields using DAST (diethylaminosulfur trifluoride), which had to be used in excess (2.2 equiv.), probably because of interference with the urea moiety.

Scheme 1. Synthesis of the SupraBox ligands. Reagents and conditions: (a) RNCO (1 equiv.), THF or aq. NaOH, 60-70%; (b) iPr_2EtN (2.5 equiv.), HBTU (1.3 equiv.), amino alcohol (1.2 equiv.), CH₂Cl₂, 0 °C to r.t., 16 h, 85–99%; (c) DAST (2.2 equiv.), THF, -78 °C to r.t.; (d) K₂CO₃, 75–90%.

For the synthesis of ligands **15** and **16**, featuring the aspartic α -pyrrolidinamide linker, a slightly different protocol was followed (Scheme 2). Starting from L- or D-aspartic acid β -allyl ester **21**,^[7] the corresponding phenyl urea **22** was assembled and then treated with pyrrolidine to obtain

Figure 2. The SupraBox ligand library.

Scheme 2. Synthesis of ligands **15** and **16**. Reagents and conditions: (a) PhNCO (1 equiv.), Et₃N (1 equiv.), THF, r.t., 88%; (b) *i*Pr₂EtN (2.5 equiv.), HBTU (1.3 equiv.), pyrrolidine (1.2 equiv.), DMF, 78%; (c) pyrrolidine (1.2 equiv.), Ph₃P (0.18 equiv.), [Pd(Ph₃P)] (0.04 equiv.), CH₂Cl₂, 77%; (d) *i*Pr₂EtN (2.5 equiv.), HBTU (1.3 equiv.), L-valinol (1.2 equiv.), CH₂Cl₂, 60%; (e) DAST (2.2 equiv.), THF, -78 °C to r.t.; (f) K₂CO₃, 58%.

the α -pyrrolidinamide derivative **23**. The allyl ester was cleaved by reaction with [Pd(PPh₃)₄]/pyrrolidine, and the resulting β -carboxylic acid was transformed into the oxazoline nucleus by reaction with (*S*)-valinol and then DAST-mediated ring closure.

Altogether, four different amino-acid spacers (β -alanine, 2-amino-isobutyric acid, *m*-amino benzoic acid and aspartic acid α -pyrrolidine-carboxamide) were used to impart different conformational rigidity to the ligands, and so influence the formation of intramolecular hydrogen bonds between the urea moieties. In addition, three different isocyanates were included in the screening to vary the hydrogenbond-forming properties of the ligands, as well as five amino alcohols derived from natural α -amino acids to tune the transfer of the stereochemical information. In this way, a small collection of 16 ligands was prepared for testing.

Complexation Studies

Before screening the library of ligands in catalytic applications, we set out to investigate the formation of transition-metal complexes of the SupraBox ligands. The structures of complexes of supramolecular bidentate ligands containing additional functionalities capable of hydrogenbonding interactions have usually been assessed spectroscopically,^[5c,8] by ¹H, ¹³C, and ³¹P-NMR spectroscopy. ESI-MS has also been used, since this ionization methodology allowed the detection of the ion of the self-assembled complex, as has X-ray structural analysis, which showed the self-organized complex, held together by non-covalent interactions (metal coordination, intermolecular hydrogen bonding, and π -stacking).

The copper(II) complex of ligand (*S*)-9 was obtained by treating it with $CuCl_2$ in CH_2Cl_2 , followed by recrystallization of the crude material from CH_2Cl_2/n -hexane. Its mo-

lecular composition was assessed by ESI-MS spectroscopy, which revealed one principal peak at m/z = 613.3, corresponding to a copper(I) atom coordinated to two molecules of ligand, i.e., [CuL₂]⁺. The reduction of Cu²⁺ to Cu⁺ has been reported to occur when ESI is used as an ionization source.^[9] The presence of two ligands coordinated to Cu²⁺ was further confirmed by a measurement of the complex absorbance as a function of the ligand/metal ratio, also known as Yoe-Jones method^[10] (Figure 3). This plot showed a quasi-linear increase of the complex-absorbance value up to a combining ratio of 2:1. Addition of further ligand produced an almost negligible variation in the absorbance. The deviation from linearity could depend on the stability of the complex with respect to ligand dissociation:^[11] the more stable the complex, the closer the experimental curve approaches a straight line.

Figure 3. Yoe–Jones plot of complex absorbance as a function of ligand/metal ratio of complex $[Cu(9)_2Cl_2]$. Ligand (*S*)-9 was added in accurately weighed portions to CuCl₂ in CH₂Cl₂, and UV absorption spectra were recorded after each addition.

The formation of palladium(II) complexes was also investigated: palladium chloride was treated with 2 equiv. ligand (S)-9 in dichloromethane, and the complex $[Pd(S-9)_2-$ Cl₂] was isolated by precipitation from hexanes. Since in this case the complex is diamagnetic, the supramolecular bidentate ligand $[Pd(S-9)_2Cl_2]$ could be studied by ¹H NMR spectroscopy. It is important to note that only one set of signals could be detected in the NMR spectra at room temperature, and the two coordinated molecules of 9, i.e., the one acting as hydrogen-bond donor and the other as acceptor (Figure 4), could not be distinguished. The hydrogen-bonding state of the NH protons for both the free ligand and the Pd complex was also studied. In particular, the variation of the chemical shifts of the NH signals upon dilution was considered for both the ligand and the Pd complex. At 5 mm, the NH protons of the complex resonated at higher chemical shifts than did those of the free ligand (5.74 vs. 5.62 ppm for NH_A , and 7.03 vs. 6.80 ppm for NH_B), and their chemical shifts had a lower concentration dependence over the 5–40 mM range ($\Delta \delta = 0.1$ vs. 0.27 ppm for NH_A, and $\Delta \delta = 0.1$ vs. 0.32 ppm for NH_B, see the Supporting Information for the values and graphics) than those of the free ligand. The temperature dependence of the NH signals was also investigated, but on cooling, the signals broadened and coalesced, and two signals appeared

at temperatures lower than 268 K, which hampered the measurement of the temperature coefficient $(\Delta\delta/\Delta T)$ of each NH proton. These experiments, which are commonly used to differentiate between random-coil peptides and peptides in hydrogen-bonded conformations,^[12] indicate that the two ligands coordinated to the metal atom interact intramolecularly by hydrogen bonding.

Figure 4. SupraBox: general structure of the ligands and of the supramolecular bidentate complex.

Enantioselective Catalytic Applications

Copper bis(oxazoline) complexes have been shown to be efficient catalysts in the kinetic resolution of racemic diols,^[13] and in particular of hydrobenzoin, by benzoylation.^[14] For this reason, we decided to screen ligands 1– 16 in this reaction (Table 1). In addition, mono(oxazoline) 17^[15] (Figure 2) devoid of functional groups capable of forming hydrogen bonds, was added to the screening to confirm the importance of the supramolecular interaction.

In the catalytic reactions, the complexes were preformed by stirring a suspension of CuCl₂ in a solution of the ligand in CH₂Cl₂ until all of the highly insoluble copper salt became soluble by complexation with the ligand (as seen by the formation of a deeply colored solution). Despite the structural similarities between 1-16, their performance in the asymmetric benzoylation varied considerably, and rather surprisingly, the best selectivities were obtained with ligands 9 and 11. Ligands 10 and 12, with benzyl and phenyl substitution at the stereocenters, substituents that had proved most successful in the same reaction with bis-(oxazoline) ligands,^[13,14] gave inferior results. From a closer inspection of the selectivities, the importance of a fine balance of conformational flexibility, steric hindrance, and electronic properties becomes evident. In particular, the meta-disubstituted aromatic linker (Table 1, entries 1-6) and the C_a-tetrasubstituted amino acid (Aib) hamper enantioselectivity, probably because of the high degree of rigidity which does not allow an efficient docking of the two urea functionalities. In fact, the use of a β -alanine linker (Table 1, entries 9–14), which is best combined with an isopropyl or ethyl substitution at the oxazoline moiety, results in a significant increase in selectivity (Table 1, entries 9 and 11, respectively). Finally, no selectivity was obtained with the monodentate ligand 17, which is not capable of supramolecular interactions (Table 1, entry 18).

Asymmetric catalytic acylation with copper(II) complexes has also been applied to the desymmetrization of *meso* diols,^[17] albeit with *ee* values lower than those obtained in the kinetic resolution (58%*ee* in the asymmetric benzoylation of *meso*-hydrobenzoin^[17a]). We tested a selection of ligands in the desymmetrization of *meso*-hydrobenzoin by benzoylation, and the results are collected in Table 2.

Once again, satisfactory results were obtained with ligands 9 and 11 (Table 2, entries 5 and 7). Notably, the SupraBox ligands outperform the classical methylene-bridged bis(oxazolines) and aza-bis(oxazolines), probably because the flexibility of the non-covalent linker allows these *meso* substrates to be accommodated in the copper(II) coordination sphere. In contrast, the rigidity of the classical bis(oxazolines) creates a cavity where the C_2 -symmetric (D,L)-vicdiols can fit better than the σ -symmetric *meso* diols. Also in this case, ligand 17, devoid of functionalities that can as hydrogen-bond donors, catalyzed the benzoylation in an unselective way (Table 2, entry 13).

Conclusions

A new class of supramolecular bidentate nitrogen ligands has been investigated. These ligands feature a chiral oxazoline ring and a urea functionality linked by a spacer. A 16membered library was prepared, made up of 5 differently substituted oxazoline nuclei, 4 linkers, and 3 different urea substituents. The coordination of these ligands to copper(II) and palladium(II) ions was studied, revealing that: (i) two ligands coordinate to the metal ions via their oxazoline nitrogen atoms; (ii) the NHs of the urea moiety are intramolecularly hydrogen-bonded, as indicated by the downfield values and low concentration dependence of their chemical shifts. The SupraBox library was screened in the kinetic resolution of racemic hydrobenzoin and the desymmetrization of meso-hydrobenzoin by copper-catalyzed benzoylation. Good selectivities (s) were obtained in the kinetic resolution, while the use of SupraBox ligands proved particularly beneficial in the desymmetrization of hydrobenzoin, outperforming classical bis(oxazolines).

Further studies are currently underway to find further applications for this new class of ligands.

Experimental Section

General Remarks: All reactions were carried out in flame-dried glassware with magnetic stirring under a nitrogen atmosphere unless otherwise stated. Dry solvents (over molecular sieves in bottles with crown cap) were purchased from Fluka and stored under nitrogen. Reactions were monitored by analytical thin-layer chromatography (TLC) using silica gel 60 F₂₅₄ pre-coated glass plates (0.25 mm thickness). Visualization was accomplished by irradiation with a UV lamp and/or staining with a potassium permanganate alkaline solution. Flash column chromatography was performed using silica gel 60 Å, particle size 40-64 µm, following the procedure by Still and co-workers.^[18] Proton NMR spectra were recorded with a spectrometer operating at 400.13 MHz. Proton chemical shifts are reported in ppm (δ) with the solvent reference relative to tetramethylsilane (TMS) employed as the internal standard (CDCl₃ δ = 7.26 ppm; [D₆]DMSO, δ = 2.50 ppm; CD₃OD, δ = 3.33 ppm). The following abbreviations are used to describe spin multiplicity: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad signal, dd = doublet of doublets. ¹³C NMR spectra were recorded with a 400 MHz spectrometer operating at 100.56 MHz with complete proton decoupling. Carbon chemical shifts are reported in ppm (δ) relative to TMS with the respective

solvent resonance as the internal standard (CDCl₃, δ = 77.23 ppm; $[D_6]DMSO, \delta = 39.51 \text{ ppm}; CD_3OD, \delta = 49.05 \text{ ppm}).$ Infra-red spectra were recorded with a standard FTIR spectrometer. Optical rotation values were measured with an automatic polarimeter with a 1 dm cell at the sodium D line ($\lambda = 589$ nm). HPLC was performed with an instrument equipped with a diode array detector, using a chiral column. High-resolution mass spectra (HRMS) were performed with a Fourier Transform Ion Cyclotron Resonance (FT-ICR) Mass Spectrometer APEX II & Xmass software (Bruker Daltonics) - 4.7 T Magnet (Magnex) equipped with ESI source, available at CIGA (Centro Interdipartimentale Grandi Apparecchiature) c/o Università degli Studi di Milano. Low-resolution mass spectra (MS) were acquired either with a Thermo-Finnigan LCQ Advantage mass spectrometer (ESI ion source) or with a VG Autospec M246 spectrometer (FAB ion source). Elemental analyses were performed with a Perkin-Elmer Series II CHNS/O Analyzer 2000.

Materials: Commercially available reagents were used as received. 4-aspartic acid β -allyl ester^[7] (21) and (*S*)-4-isopropyl-2-phenyl-4,5dihydrooxazole^[15] (17) were prepared according to literature procedures.

3-(3-Phenylureido)benzoic Acid (19a): Phenylisocyanate (1.59 mL, 14.5 mmol, 1.0 equiv.) and 3-aminobenzoic acid (2.0 g, 14.5 mmol, 1.0 equiv.) were dissolved in THF (80 mL), and the reaction mixture was stirred at room temperature for 3 d. The mixture was treated with cold Et₂O to induce precipitation of the product **19a** (2.34 g, 9.15 mmol, 63%) as a fine white powder. $R_{\rm f} = 0.35$ (CH₂Cl₂/MeOH, 95:5). M.p. 152–153 °C. ¹H NMR (400 MHz, CD₃OD, 25 °C): $\delta = 7.03$ (m, 1 H), 7.30 (m, 2 H), 7.37–7.46 (m, 3 H), 7.68 (ddd, J = 7.7, 1.5, 1.1 Hz, 1 H), 7.73 (ddd, J = 8.0, 2.3, 1.1 Hz, 1 H), 8.08 (t, J = 1.7 Hz, 1 H) ppm. ¹³C NMR (100.6 MHz, CD₃OD, 25 °C): $\delta = 119.1$, 119.9, 122.6, 123.2, 123.5, 128.4, 128.6, 131.2, 139.0, 139.5, 151.1, 168.2 ppm. IR: $\tilde{v} = 3354$, 2724, 1738, 1680, 1649, 1556, 1310, 1156, 1066 cm⁻¹. C₁₄H₁₂N₂O₃ (256.26): calcd. C 65.62, H 4.72, N 10.93; found C 63.38, H 4.44, N 10.81.

3-[3-(2-Nitrophenyl)ureidolbenzoic Acid (19b): 2-nitrophenyl isocyanate (1.0 g, 6.09 mmol, 1.0 equiv.) and 3-aminobenzoic acid (0.84 g, 6.09 mmol, 1.0 equiv.) were dissolved in THF (60 mL), and the reaction mixture was stirred at room temperature for 3 d. The mixture was treated with cold Et₂O to induce precipitation of the product 19b (1.36 g, 4.50 mmol, 74%) as a fine yellow powder. $R_{\rm f}$ = 0.26 (CH₂Cl₂ /MeOH, 95:5). M.p. 174–175 °C. ¹H NMR (400 MHz, DMSO, 25 °C): δ = 7.22 (ddd, J = 8.4, 7.2, 1.2 Hz, 1 H), 7.42 (t, J = 7.8 Hz, 1 H), 7.59 (dt, J = 7.7, 1.2 Hz, 1 H), 7.66– 7.73 (m, 2 H), 8.09 (dd, J = 8.4, 1.6 Hz, 1 H), 8.15 (t, J = 1.8 Hz, 1 H), 8.29 (dd, J = 8.5, 1.2 Hz, 1 H), 9.61 (s, 1 H), 10.03 (s, 1 H), 12.93 (s, 1 H) ppm. ¹³C NMR (100.6 MHz, DMSO, 25 °C): δ = 119.7, 122.8, 123.0, 123.7, 125.8, 129.6, 131.9, 135.2, 135.4, 138.3, 140.0, 152.3, 167.6 ppm. IR: $\tilde{v} = 3354$, 3281, 2724, 1829, 1739, 1652, 1543, 1310, 1155, 1073, 949 cm⁻¹. $C_{14}H_{11}N_3O_5$ (301.25): calcd. C 55.82, H 3.68, N 13.95; found C 55.54, H 3.34, N 14.30.

2-Methyl-2-(3-phenylureido)propanoic Acid (19c): 2-Aminoisobutyric acid (3.0 g, 29 mmol, 1.3 equiv.) was suspended in 2 M NaOH (10 mL), then phenylisocyanate (2.37 mL, 22 mmol, 1.0 equiv.) was added, and the mixture reaction was stirred for 60 min at room temperature. The mixture was filtered and the product was precipitated from solution by the slow addition of 1 M HCl. The white solid was dissolved in 1 M NaOH (10 mL), and the solution was washed with CH₂Cl₂. Addition of 1 M HCl induced the precipitation of product **19c** (1.73 g, 7.78 mmol, 35%) as a fine white powder. $R_{\rm f} = 0.37$ (CH₂Cl₂/MeOH, 95:5). M.p. 157–158 °C. ¹H NMR (400 MHz, CD₃OH, 25 °C): $\delta = 1.53$ (s, 6 H), 6.41 (s, 1 H), 6.95

(m, 1 H), 7.24 (m, 2 H), 7.30 (m, 2 H), 8.19 (s, 1 H) ppm. 13 C NMR (100.6 MHz, CD₃OD, 25 °C): δ = 24.6, 55.3, 118.6, 121.9, 128.3, 139.4, 155.7, 177.3 ppm. IR: \tilde{v} = 3381, 2724, 1704, 1648, 1544, 1308, 1158, 1069 cm⁻¹. C₁₁H₁₄N₂O₃ (222.24): calcd. C 59.45, H 6.35, N 12.60; found C 59.55, H 5.55, N 12.61.

3-(3-Phenylureido)propanoic Acid (19d): Phenylisocyanate (5.0 mL, 44 mmol, 1.0 equiv.) was dissolved in THF (220 mL), and then β-alanine (3.92 g, 44 mmol, 1.0 equiv.) was added. The reaction mixture was stirred at room temperature for 3 d. The mixture was treated with cold Et₂O to induce precipitation of the product. After filtration, the crude product was purified by flash chromatography eluting with $3\rightarrow10\%$ MeOH in CH₂Cl₂ to yield product 19d (8.33 g, 40 mmol, 91%) as a fine white powder. $R_{\rm f}$ = 0.24 (CH₂Cl₂/ MeOH, 95:5). M.p. 160–161 °C. ¹H NMR (400 MHz, CD₃OD, 25 °C): δ = 2.55 (t, *J* = 6.3 Hz, 2 H), 3.47 (t, *J* = 6.3 Hz, 2 H), 6.98 (t, *J* = 6.8 Hz, 1 H), 7.25 (dd, *J* = 8.4, 7.4 Hz, 2 H), 7.33 (m, 2 H) ppm. ¹³C NMR (100.6 MHz, CDCl₃, 25 °C): δ = 34.1, 35.2, 119.0, 122.0, 128.4, 139.5, 156.8, 174.3 ppm. IR: \tilde{v} = 3584, 3329, 2725, 1694, 1638, 1571, 1108 cm⁻¹. C₁₀H₁₂N₂O₃ (208.21): calcd. C 57.68, H 5.81, N 13.45; found C 57.73, H 5.57, N 13.81.

3-[3-(2-Nitrophenyl)ureido]propanoic Acid (19e): 2-Nitro-phenylisocyanate (1.000 g, 6.09 mmol, 1.0 equiv.) was dissolved in THF (30 mL), and then β -alanine (1.085 g, 12.18 mmol, 2.0 equiv.) was added. The reaction mixture was stirred at room temperature for 3 d. The mixture was treated with cold Et₂O to induce precipitation of the product. After filtration, the crude product was purified by flash chromatography eluting with $3\rightarrow 5\%$ MeOH in CH₂Cl₂ to vield product 19e (1.077 g, 4.25 mmol, 67%) as a fine yellow powder. $R_{\rm f} = 0.41$ (CH₂Cl₂/MeOH, 95:5). M.p. 160–161 °C. ¹H NMR (400 MHz, CDCl₃, 25 °C): δ = 2.56 (t, J = 6.6 Hz, 2 H), 3.48 (t, J = 6.6 Hz, 2 H), 7.13 (ddd, J = 8.5, 7.2, 1.3 Hz, 1 H), 7.61 (ddd, J= 8.6, 7.2, 1.6 Hz, 1 H), 8.12 (dd, J = 8.5, 1.6 Hz, 1 H), 8.35 (dd, J = 8.6, 1.3 Hz, 1 H) ppm. ¹³C NMR (100.6 MHz, CD₃OD, 25 °C): $\delta = 33.8, 35.5, 121.4, 122.1, 125.1, 134.6, 135.7, 137.1, 155.4,$ 174.0 ppm. IR: $\tilde{v} = 3583, 3393, 3330, 2753, 2360, 1694, 1611, 1582,$ 1539, 1342, 1258, 1142, 1085, 798 cm⁻¹. $C_{10}H_{11}N_3O_5$ (253.21): calcd. C 47.43, H 4.38, N 16.59; found C 47.62, H 4.23, N 16.29.

3-(3-Cyclohexylureido)propanoic Acid (19f): Cyclohexylisocyanate (2.86 mL, 22 mmol, 1.0 equiv.) was dissolved in THF (150 mL), and then β -alanine (2.00 g, 22.4 mmol, 1.0 equiv.) was added. The reaction mixture was stirred at room temperature for 3 d. The mixture was treated with cold Et₂O to induce precipitation of the product. After filtration, the crude product was purified by flash chromatography eluting with $5\rightarrow 15\%$ MeOH in CH₂Cl₂ to yield product 19f (3.60 g, 16.8 mmol, 76%) as a fine white powder. $R_{\rm f}$ = 0.23 (CH₂Cl₂/MeOH, 95:5). M.p. 159–160 °C. ¹H NMR (400 MHz, $[D_6]DMSO, 25 \text{ °C}$: $\delta = 0.97-1.16 \text{ (m, 3 H)}, 1.18-1.30 \text{ (m, 2 H)},$ 1.50 (m, 1 H), 1.61 (m, 1 H), 1.70 (m, 1 H), 2.31 (t, J = 6.5 Hz, 2 H), 3.15 (q, J = 6.5 Hz, 2 H), 5.74 (t, J = 5.8 Hz, 1 H), 5.83 (d, J = 7.9 Hz, 1 H), 12.17 (s, 1 H) ppm. 13 C NMR (100.6 MHz, [D₆]-DMSO, 25 °C): $\delta = 24.9$, 25.8, 33.7, 35.5, 35.7, 48.1, 157.7, 173.9 ppm. IR: v = 3335, 1699, 1626, 1580, 1535, 1307, 1248, 1222, 1080, 921 cm⁻¹. C₁₀H₁₈N₂O₃ (214.26): calcd. C 56.06; H 8.47; N 13.07; found C 55.87, H 8.62, N 12.72.

General Procedure for the Synthesis of Products 20a–n, **25a** and **25b**: Acid **19** or **24** (1.1 equiv.) and *N*,*N*-diisopropylethylamine (3 equiv.) were dissolved in CH₂Cl₂ (0.1 M), and the solution was cooled to 0 °C. HBTU (1.3 equiv.) was added, and the solution was stirred at the same temperature for 30 min. Then the amino alcohol (1.0 equiv.) was added, and the reaction mixture was stirred at 0 °C for 60 min and then overnight at room temperature. The solvent was evaporated under reduced pressure, and the mixture was separated by flash chromatography eluting with MeOH (gradient from 2 to 10%) in CH₂Cl₂ to yield product **20** or **25**.

(*S*)-*N*-(1-Hydroxy-3-methylbutan-2-yl)-3-(3-phenylureido)benzamide (20a): According to the general procedure, product 20a (0.578 g, 1.69 mmol, 96%) was obtained as a white solid, starting from acid 19a (0.500 g, 1.95 mmol) and L-valinol. $R_{\rm f} = 0.38$ (CH₂Cl₂/MeOH, 95:5). M.p. 167–168 °C. $[a]_{\rm D}^{20} = -44.37$ (c = 0.1, CHCl₃). ¹H NMR (400 MHz, CD₃OD, 25 °C): $\delta = 1.00$ (d, J = 6.8 Hz, 3 H), 1.03 (d, J = 6.8 Hz, 3 H), 2.00 (m, 1 H), 3.67–3.76 (m, 2 H), 3.91 (m, 1 H), 7.03 (t, J = 7.3 Hz, 1 H), 7.30 (m, 2 H), 7.39 (t, J = 7.9 Hz, 1 H), 7.44 (dd, J = 8.7, 1.2 Hz, 2 H), 7.48 (dt, J = 7.7, 1.3 Hz, 1 H), 7.58 (ddd, J = 8.1, 2.1, 1.0 Hz, 1 H), 7.88 (t, J = 1.8 Hz, 1 H) ppm. ¹³C NMR (100.6 MHz, CD₃OD, 25 °C): $\delta = 17.8$, 18.7, 28.9, 57.4, 61.7, 117.9, 119.0, 121.2, 121.8, 122.6, 128.4, 128.6, 135.7, 138.9, 139.4, 153.9, 169.2 ppm. IR: $\tilde{v} = 3266, 3200, 2722, 1656, 1609, 1565, 1501,$ 1310, 1221, 1167, 1089, 989, 840 cm⁻¹. C₁₉H₂₃N₃O₃ (341.40): calcd. C 66.84, H 6.79, N 12.31; found C 66.62, H 7.14, N 12.14.

(*R*)-*N*-(1-Hydroxybutan-2-yl)-3-(3-phenylureido)benzamide (20b): According to the general procedure, product 20b (0.565 g, 1.72 mmol, 97%) was obtained as a white solid, starting from acid **19a** (0.500 g, 1.95 mmol) and (*R*)-2-aminobutan-1-ol. $R_{\rm f} = 0.40$ (CH₂Cl₂/MeOH, 95:5). M.p. 146–147 °C. $[a]_D^{20} = +42.58$ (c = 0.1, CHCl₃). ¹H NMR (400 MHz, CD₃OD, 25 °C): δ = 1.00 (t, J = 7.5 Hz, 3 H), 1.56 (m, 1 H), 1.76 (m, 1 H), 3.63 (dd, J = 5.6, 0.9 Hz, 2 H), 4.03 (m, 2 H), 7.03 (t, J = 7.3 Hz, 1 H), 7.29 (dd, J = 8.5, 7.5 Hz, 2 H), 7.36 (t, J = 7.8 Hz, 1 H), 7.44 (dd, J = 8.7, 1.2 Hz, 2 H), 7.48 (dt, J = 7.7, 1.3 Hz, 1 H), 7.58 (ddd, J = 7.9, 2.2, 1.1 Hz, 1 H), 7.88 (t, J = 1.8 Hz, 1 H), 8.05 (d, J = 8.3 Hz, 1 H) ppm. ¹³C NMR (100.6 MHz, CD₃OD, 25 °C): δ = 9.6, 23.66, 53.7, 63.43, 117.9, 119.1, 121.2, 121.9, 122.6, 128.5, 128.7, 135.6, 138.9, 139.4, 153.9, 169.2 ppm. IR: $\tilde{v} = 3383$, 2724, 1697, 1648, 1542, 1154, 1069 cm⁻¹. C₁₈H₂₁N₃O₃ (327.38): calcd. C 66.04, H 6.47, N 12.84; found C 65.93, H 6.70, N 12.58.

(S)-N-(1-Hydroxy-3-phenylpropan-2-yl)-3-(3-phenylureido)benzamide (20c): According to the general procedure, product 20c (0.689 g, 1.77 mmol, 100%) was obtained as a white solid, starting from acid 19a (0.500 g, 1.95 mmol) and (S)-2-amino-3-phenylpropan-1-ol. $R_{\rm f} = 0.34$ (CH₂Cl₂/MeOH, 95:5). M.p. 157–158 °C. $[a]_{\rm D}^{20}$ = -50.29 (c = 0.1, CHCl₃). ¹H NMR (400 MHz, CD₃OD, 25 °C): $\delta = 2.87$ (dd, J = 13.7, 8.6 Hz, 1 H), 3.03 (dd, J = 13.7, 6.2 Hz, 1 H), 3.66 (d, J = 5.5 Hz, 2 H), 4.34 (m, 1 H), 7.04 (t, J = 7.5 Hz, 1 H), 7.17 (m, 1 H), 7.29 (m, 6 H), 7.37 (m, 2 H), 7.45 (dd, J = 8.6, 1.0 Hz, 2 H), 7.56 (dt, J = 7.0, 2.2 Hz, 1 H), 7.79 (m, 1 H) ppm. ¹³C NMR (100.6 MHz, CD₃OD, 25 °C): δ = 36.6, 53.6, 62.9, 117.8, 119.0, 121.1, 121.8, 122.6, 125.9, 128.0, 128.5, 128.6, 129.0, 134.7, 135.5, 138.5, 139.0, 139.3, 153.9, 168.8 ppm. IR: $\tilde{v} = 3324, 2724,$ 1739, 1648, 1543, 1310, 1265, 1155, 1069, 876, 840 cm⁻¹. $C_{23}H_{23}N_3O_3$ (389.45): calcd. C 70.93, H 5.95, N 10.79; found C 70.88, H 6.18, N 7.78.

(*S*)-*N*-(1-Hydroxy-3,3-dimethylbutan-2-yl)-3-(3-phenylureido)benzamide (20d): According to the general procedure, product 20d (0.552 g, 1.55 mmol, 88%) was obtained as a white solid, starting from acid 19a (0.500 g, 1.95 mmol) and (*S*)-2-amino-3,3-dimethylbutan-1-ol. $R_f = 0.37$ (CH₂Cl₂/MeOH, 95:5). M.p. 97–98 °C. [a]_D²⁰ = -49.69 (c = 0.1, CHCl₃). ¹H NMR (400 MHz, CD₃OD, 25 °C): $\delta = 1.02$ (s, 9 H), 3.63 (dd, J = 11.4, 8.8 Hz, 1 H), 3.68 (dd, J = 11.4, 3.5 Hz, 1 H), 4.04 (dd, J = 8.8, 3.5 Hz, 1 H), 7.04 (m, 1 H), 7.30 (m, 1 H), 7.40 (t, J = 7.7 Hz, 1 H), 7.42–7.50 (m, 3 H), 7.59 (ddd, J = 7.9, 2.2, 1.1 Hz, 1 H) 7.87 (t, J = 1.7 Hz, 1 H) ppm. ¹³C NMR (100.6 MHz, CD₃OD, 25 °C): $\delta = 26.0$, 33.9, 54.4, 60.9, 117.9, 119.1, 121.3, 121.8, 122.6, 128.5, 128.7, 136.0, 138.9, 139.2, 153.9, 169.9 ppm. 4-(Allyloxy)-4-oxo-2-(3-phenylureido)butanoic Acid (22a-b): 4-(Allyloxy)-2-amino-4-oxobutanoic acid hydrochloride 21a-b (1.20 g, 5.72 mmol, 1.0 equiv.) was suspended in THF (57 mL), and triethylamine (0.79 mL, 5.72 mmol, 1.0 equiv.) was added dropwise. The reaction mixture was vigorously stirred for 30 min, then phenylisocyanate (0.65 mL, 5.72 mmol, 1.0 equiv.) was added and the mixture was stirred for 3 d at room temperature. The mixture was treated with cold Et_2O to induce precipitation of a white powder. The solid was washed with KHSO₄ 1 M to obtain products 22a and **22b** as fine white powders (*R*-enantiomer: 1.394 g, 4.77 mmol, 83%. S-enantiomer: 1.407 g, 4.81 mmol, 84%). $R_{\rm f} = 0.28$ (CH₂Cl₂/ MeOH, 95:5). M.p. 186-187 °C. ¹H NMR (400 MHz, CDCl₃, 25 °C): δ = 2.86 (br. s, 2 H), 4.54 (br. s, 2 H), 4.78 (br. s, 1 H), 5.19 (d, J = 10.4 Hz, 1 H), 5.26 (d, J = 17.1 Hz, 1 H), 5.84 (m, 1 H),6.8 (br. s, 1 H), 6.96 (t, J = 6.8 Hz, 1 H), 7.20 (t, J = 7.1 Hz, 2 H), 7.39 (d, J = 7.0 Hz, 2 H), 8.46 (br. s, 1 H), 11.23 (br. s, 1 H) ppm. ¹³C NMR (100.6 MHz, CDCl₃, 25 °C): δ = 36.5, 49.9, 65.6, 118.4, 119.4, 122.6, 128.8, 131.8, 139.1, 156.5, 170.9 ppm. IR: $\tilde{v} = 3311$, 2738, 2603, 2531, 2496, 1716, 1702, 1596, 1547, 1397, 1172, 1072, 1036, 851, 807 cm⁻¹. C₁₄H₁₆N₂O₅ (292.29): calcd. C 57.53, H 5.52, N 9.58; found C 57.89, H 5.87, N 9.34.

Allyl 4-Oxo-3-(3-phenylureido)-4-(pyrrolidin-1-yl)butanoate (23a,b): 4-(Allyloxy)-4-oxo-2-(3-phenylureido)butanoic acid 22a,b (1.300 g, 4.45 mmol, 1.0 equiv.) and N,N-diisopropylethylamine (1.90 mL, 11.1 mmol, 2.5 equiv.) were dissolved in DMF (45 mL), and the solution was cooled to 0 °C. HBTU (1.3 equiv.) was added, and the solution was stirred at the same temperature for 30 min. Then pyrrolidine (0.44 mL, 5.34 mmol, 1.2 equiv.) was added, and the reaction mixture was stirred at 0 °C for 60 min and then overnight at room temperature. The solvent was evaporated under reduced pressure, and the mixture was separated by flash chromatography eluting with MeOH (gradient from 2 to 6%) in CH₂Cl₂ to yield products 23a,b as pale yellow oils (R-enantiomer: 1.122 g, 3.24 mmol, 73%. S-enantiomer: 1.199 g, 3.47 mmol, 78%). $R_{\rm f}$ = 0.28 (CH₂Cl₂/MeOH, 95:5). ¹H NMR (400 MHz, CDCl₃, 25 °C): δ = 1.88 (m, 2 H), 1.99 (m, 2 H), 2.68 (dd, J = 15.8, 6.7 Hz, 1 H), 2.89 (dd, J = 15.8, 7.4 Hz, 1 H), 3.42 (m, 2 H), 3.67 (m, 1 H), 3.78 (m, 1 H), 4.59 (t, J = 1.3 Hz, 1 H), 4.61 (t, J = 1.3 Hz, 1 H), 5.01 (t, J = 7.0 Hz, 1 H), 5.20 (ddd, J = 10.5, 2.7, 1.2 Hz, 1 H), 5.31(ddd, J = 17.2, 3.0, 1.6 Hz, 1 H), 5.92 (m, 1 H), 6.98 (m, 1 H), 7.24(m, 2 H), 7.34 (dd, J = 8.8, 1.0 Hz, 2 H) ppm. ¹³C NMR $(100.6 \text{ MHz}, \text{CDCl}_3, 25 \text{ °C})$: $\delta = 23.7, 25.5, 36.6, 46.0, 46.5, 48.2,$ 65.1, 117.2, 118.8, 122.3, 128.4, 132.1, 139.2, 155.7, 170.2, 170.4 ppm. IR: \tilde{v} = 2721, 2656, 2512, 2345, 1721, 1678, 1600, 1329, 1178, 1109, 1074, 997, 856 cm⁻¹. C₁₈H₂₃N₃O₄ (345.39): calcd. C 62.59, H 6.71, N 12.17; found C 62.33, H 6.57, N 11.99.

4-Oxo-3-(3-phenylureido)-4-(pyrrolidin-1-yl)butanoic Acid (24a,b): Allyl 4-oxo-3-(3-phenylureido)-4-(pyrrolidin-1-yl)butanoate **23a,b** (1.10 g, 3.18 mmol, 1.0 equiv.) was dissolved in CH₂Cl₂ (30 mL), and the solution was cooled to 0 °C. Pyrrolidine (0.31 mL, 3.82 mmol, 1.2 equiv.), triphenylphosphane (0.149 g, 0.57 mmol, 0.18 equiv.) and tetrakis(triphenylphosphane)palladium(0) (0.147 g, 0.13 mmol, 0.04 equiv.) were added, and the reaction mixture was stirred for 1 h at 0 °C. The mixture was poured into EtOAc (200 mL) and extracted with satd. NaHCO₃ solution (5 × 30 mL). The combined organic layers were acidified to pH 2 with 1 M KHSO₄ solution. The acidified aqueous solution was extracted with CH₂Cl₂ (3 × 25 mL), and the combined organic layers were dried with Na₂SO₄ and concentrated under reduced pressure. The crude product was purified by flash chromatography eluting with 6% MeOH in CH₂Cl₂ to yield products **24a,b** as yellow solids [(*R*)enantiomer 0.754 g, 2.47 mmol, 77%. (*S*)-enantiomer 0.778 g, 2.55 mmol, 80%]. $R_{\rm f} = 0.30$ (CH₂Cl₂/MeOH, 95:5). M.p. 168– 169 °C. ¹H NMR (400 MHz, CDCl₃, 25 °C): $\delta = 1.85$ (m, 2 H), 1.96 (m, 2 H), 2.73 (dd, J = 15.7, 6.2 Hz, 1 H), 2.84, (dd, J = 15.7, 6.1 Hz, 1 H), 3.44 (m, 2 H), 3.62 (m, 1 H), 3.80 (m, 1 H), 5.13 (m, 1 H), 6.75 (d, J = 8.8 Hz, 1 H), 6.97 (t, J = 7.5 Hz, 1 H), 7.21 (t, J = 7.5 Hz, 2 H), 7.34 (d, J = 7.7 Hz, 2 H), 8.08 (s, 1 H) ppm. ¹³C NMR (100.6 MHz, CDCl₃, 25 °C): $\delta = 24.1$, 25.9, 37.5, 46.6, 47.1, 48.2, 119.5, 122.7, 128.8, 139.1, 155.4, 170.6, 173.7 ppm. IR: $\tilde{v} =$ 3347, 3202, 3145, 1728, 1685, 1615, 1553, 1518, 1481, 1312, 1203, 1119, 1046, 997 cm⁻¹. C₁₅H₁₉N₃O₄ (305.33): calcd. C 59.01, H 6.27, N 13.76; found C 59.34, H 5.99, N 13.44.

(S)-N-[(S)-1-Hydroxy-3-methylbutan-2-yl]-4-oxo-3-(3-phenylureido)-4-(pyrrolidin-1-yl)butanamide (25a): According to the general procedure, product 25a (0.154 g, 0.39 mmol, 60%) was obtained as a yellow pale oil starting from acid 24a (0.200 g, 0.65 mmol) and L-valinol. $R_{\rm f} = 0.33$ (CH₂Cl₂/MeOH, 95:5). $[a]_{\rm D}^{20} = -78.04$ (c = 0.1, CHCl₃). ¹H NMR (400 MHz, CD₃OD, 25 °C): $\delta = 0.91$ (d, J =6.8 Hz, 3 H), 0.94 (d, J = 6.7 Hz, 3 H), 1.82-1.93 (m, 2 H), 2.00(m, 1 H), 2.57 (dd, J = 14.4, 7.4 Hz, 1 H), 2.72 (dd, J = 14.4, 6.7 Hz, 1 H), 3.38–3.60 (m, 4 H), 3.69 (m, 2 H), 3.79 (m, 1 H), 5.02 (t, J = 7.2 Hz, 1 H), 6.98 (m, 1 H), 7.24 (m, 2 H), 7.33 (m, 2 H)ppm. ¹³C NMR (100.6 MHz, CD₃OD, 25 °C): δ = 17.4, 18.6, 23.7, 25.5, 28.5, 38.4, 45.9, 46.5, 48.8, 56.7, 61.7, 118.8, 122.2, 128.4, 139.2, 155.8, 170.7 ppm. IR: $\tilde{v} = 3310$, 3259, 2767, 2456, 2412, 1665, 1565, 1508, 1459, 1334, 1300, 1211, 1098, 980, 876 cm⁻¹. C₂₀H₃₀N₄O₄ (390.48): calcd. C 61.52, H 7.74, N 14.35; found C 61.66, H 7.60, N 14.53.

(R)-N-[(S)-1-Hydroxy-3-methylbutan-2-yl]-4-oxo-3-(3-phenylureido)-4-(pyrrolidin-1-yl)butanamide (25b): According to the general procedure, product 25b (0.144 g, 0.37 mmol, 56%) was obtained as a yellow pale oil starting from acid 24b (0.200 g, 0.65 mmol) and L-valinol. $R_{\rm f} = 0.33$ (CH₂Cl₂/MeOH, 95:5). $[a]_{\rm D}^{20} = -12.35$ (c = 0.1, CHCl₃). ¹H NMR (400 MHz, CD₃OD, 25 °C): δ = 0.89 (d, J = 6.8 Hz, 3 H), 0.93 (d, J = 6.7 Hz, 3 H), 1.80–1.92 (m, 3 H), 2.00 (m, 2 H), 2.58 (dd, J = 14.3, 6.8 Hz, 1 H), 2.73 (dd, J = 14.3, 7.4 Hz, 1 H), 3.35–3.63 (m, 4 H), 3.70 (m, 2 H), 3.82 (m, 1 H), 4.99 (t, J = 7.0 Hz, 1 H), 6.98 (m, 1 H), 7.24 (m, 2 H), 7.33 (dd, J =8.8, 1.2 Hz, 2 H) ppm. ¹³C NMR (100.6 MHz, CD₃OD, 25 °C): δ = 17.3, 18.6, 23.7, 25.5, 28.5, 38.3, 45.9, 46.5, 48.7, 56.7, 61.7,118.7, 122.2, 128.4, 139.2, 155.8, 170.6, 170.8 ppm. IR: $\tilde{v} = 3300$, 3256, 2789, 2481, 2426, 1656, 1599, 1548, 1499, 1315, 1224, 1100, 978, 856 cm⁻¹. $C_{20}H_{30}N_4O_4$ (390.48): calcd. C 61.52, H 7.74, N 14.35; found C 61.84, H 7.70, N 14.39.

1-[(S)-3-{(S)-4-Isopropyl-4,5-dihydrooxazol-2-yl}-1-oxo-1-(pyrrolidin-1-yl)propan-2-yl]-3-phenylurea (15): According to the general procedure, product 15 (0.083 g, 0.22 mmol, 58%) was obtained as a yellow solid starting from precursor 25a (0.150 g, 0.38 mmol). $R_{\rm f}$ = 0.43 (CH₂Cl₂/MeOH, 95:5). M.p. 122–123 °C. $[a]_{D}^{20} = -71.70$ (c = 0.1, CHCl₃). ¹H NMR (400 MHz, CDCl₃, 25 °C): δ = 0.84 (d, J = 6.7 Hz, 3 H), 0.92 (d, J = 6.7 Hz, 3 H), 1.66 (m, 1 H), 1.87 (m, 2 H), 1.96 (m, 2 H), 2.68 (dd, J = 15.2, 6.4 Hz, 1 H), 2.82 (dd, J = 15.2, 8.0 Hz, 1 H), 3.49 (m, 2 H), 3.78-3.92 (m, 4 H), 4.20 (dd, J = 9.4, 8.2 Hz, 1 H), 5.20 (m, 1 H), 6.88–6.96 (m, 2 H), 7.22 (t, J = 7.6 Hz, 2 H), 7.36 (d, J = 7.6 Hz, 2 H), 8.26 (s, 1 H) ppm. ¹³C NMR (100.6 MHz, CDCl₃, 25 °C): *δ* = 18.3, 18.7, 24.3, 25.9, 31.8, 32.6, 46.3, 47.1, 48.3, 70.3, 72.2, 118.8, 122.1, 128.7, 139.6, 155.2, 163.7, 170.9 ppm. IR: \tilde{v} = 3330, 3223, 2721, 1656, 1623, 1567, 1504, 1398, 1311, 1214, 1200, 1178, 1123, 1083, 1034, 970 cm⁻¹. C₂₀H₂₈N₄O₃ (372.46): calcd. C 64.49, H 7.58, N 15.04; found C 64.67, H 7.30, N 14.99.

1-{(R)-3-[(S)-4-Isopropyl-4,5-dihydrooxazol-2-yl]-1-oxo-1-(pyrrolidin-1-yl)propan-2-yl}-3-phenylurea (16): According to the general procedure, product 16 (0.074 g, 0.20 mmol, 58%) was obtained as a yellow solid starting from precursor 25b (0.134 g, 0.34 mmol). $R_{\rm f}$ = 0.43 (CH₂Cl₂/MeOH, 95:5). M.p. 126–127 °C. $[a]_{D}^{20}$ = -13.76 (c = 0.1, CHCl₃). ¹H NMR (400 MHz, CDCl₃, 25 °C): δ = 0.83 (d, J = 6.7 Hz, 3 H), 0.87 (d, J = 6.7 Hz, 3 H), 1.65 (m, 1 H), 1.88 (m, 2 H), 1.97 (m, 2 H), 2.67 (dd, J = 15.6, 6.6 Hz, 1 H), 2.81 (dd, J = 15.6, 8.3 Hz, 1 H), 3.42-3.55 (m, 2 H), 3.83-3.93 (m, 4 H), 4.19 (dd, J = 8.7, 7.9 Hz, 1 H), 5.23 (m, 1 H), 6.89 (d, J = 9.5 Hz, 1 H),6.94 (t, J = 7.3 Hz, 1 H), 7.21 (t, J = 7.7 Hz, 2 H), 7.35 (d, J =7.8 Hz, 2 H), 8.35 (s, 1 H) ppm. ¹³C NMR (100.6 MHz, CDCl₃, 25 °C): δ = 18.2, 18.4, 24.3, 25.9, 31.9, 32.4, 46.3, 47.1, 48.0, 70.2, 72.1, 118.8, 122.0, 128.7, 139.8, 155.1, 163.9, 171.0 ppm. IR: v = 3312, 2729, 1678, 1634, 1603, 1593, 1549, 1334, 1212, 1150, 1115, 1084, 1065, 991, 840 cm⁻¹. C₂₀H₂₈N₄O₃ (372.46): calcd. C 64.49, H 7.58, N 15.04; found C 64.71, H 7.44, N 14.81.

Supporting Information (see footnote on the first page of this article): Copies of the ¹H NMR and ¹³C NMR spectra of all important intermediates and final products.
